An unsealed hardstand surrounding a grain silo in central Victoria has been strengthened with PolyCom Stabilising Aid.

This high throughput grain silo located in north-west Victoria bears heavy loads in and out each day. The surrounding road is unsealed, prone to dust in summer and potholes and soft spots in winter.

By strengthening the in-situ material with PolyCom Stabilising Aid

(<https://www.earthcoprojects.com.au/about-polycom/soil-stabilising-simplicity/index.html>), the road can be improved without importing new material.

The newly stabilised road will be able to withstand turning vehicles as they load and unload, and tolerate the weather extremes at both end of the seasons, remaining safe and accessible for trucks and equipment.

Have an unsealed road or hardstand that needs a breath of new life?

PolyCom Stabilising Aid builds strong roads for heavy loads. Find out more at www.earthcoprojects.com.au (<https://www.earthcoprojects.com.au>).
